

All Teeth Missing

Benefits of a fixed bridge on implants

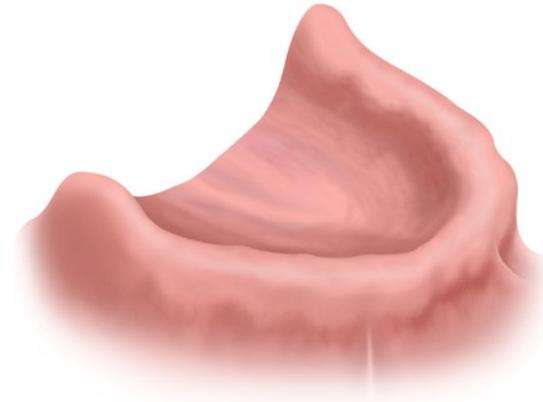

When all teeth are missing or in such condition that they need to be replaced, a fixed bridge anchored to dental implants is the best permanent solution

Before dental implants, there were no fixed solution available for people who lost all their teeth. Today, it is possible to replace a full jaw with dental implants and a fixed bridge that results in a permanent, stable and high esthetic solution.

- Lets you eat and function like having natural teeth
- A solid, stable solution that will serve you for life
- Preserves your facial appearance and prevents bone loss

Treatment

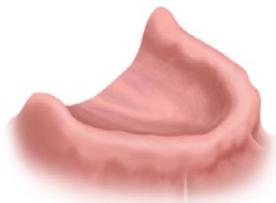

The treatment procedure and number of visits is largely dependent on the specific conditions. But all in all, 8-10 visits should be enough to have a fixed bridge installed. Most patients report that they were much more comfortable following the procedure than they had anticipated.

Course of treatment

The course of treatment described here is one of several options available. Consult your dentist to find out what the best solution is for you, given your specific condition.

Installing the fixed bridge – Step-by-step

1. Before the procedure

The dentist determines what needs to be done and prepares both himself and the patient for the coming treatment procedure.

2. Installing the implants

The first step is installing dental implants to replace the lost tooth roots. In this case, five implants are used. Temporary teeth are attached that enable you to eat and function like normal while waiting for the permanent bridge to be installed.

3. Attaching bridge

The final bridge is securely installed on top of the implants. With a full jaw replacement like this, it normally takes 2-3 visits to have the bridge completely attached.

4. Final result

Your new teeth should be hard to tell from natural – both for you and others. People who have had traditional dentures before getting a fixed bridge often describe this as an overwhelming and very positive experience.
